Abstract

Despite the spread of gender equity policies across organisations worldwide, a frustrating and well-documented gap continues to exist between what these policies promise and what employees actually experience at work. This paper examines the relationship between gender equity policies and employee well-being, using a dual lens that compares global evidence with the specific realities of Nigerian workplaces. The study draws on Social Equity Theory, Organisational Justice Theory, and Berlo's Communication Model to argue that communication is not simply a tool for delivering policy to employees but is itself a determining factor in whether those policies improve well-being or remain symbolic documents that change nothing. Using a qualitative systematic review of peer-reviewed literature, international organisational reports, and media accounts from Nigerian contexts published between 2010 and 2024, the study finds that gender equity policies substantially improve employee morale, reduce psychological stress, and strengthen organisational commitment when they are implemented genuinely. However, persistent barriers including unconscious bias, what scholars call office housework, the routine assignment of menial tasks such as note-taking, serving refreshments, and post-event clean-up exclusively to female employees, weak enforcement mechanisms, and cultures that tolerate informal discrimination continue to undermine policy effectiveness. In the Nigerian context specifically, the intersection of cultural gender norms and the adoption of internationally borrowed policy frameworks create a pattern of superficial compliance that leaves many women unprotected in practice. The paper concludes by recommending communication-centred, culturally responsive implementation strategies and contributes a reframing of gender equity policy as fundamentally a communication project requiring continuous and deliberate institutional effort.

Keywords: Gender equity, Employee well-being, Workplace inclusion, Organisational justice, Office housework, Nigerian workplace

INTRODUCTION

There is a particular kind of frustration that many women in Nigerian workplaces know very well. It is the experience of arriving at a meeting fully prepared, only to be asked, before the discussion begins, to please serve the tea. Or of watching a male colleague receive a challenging project while she is tasked with minute-taking. Or of knowing that her organisation has a gender equity policy, printed and circulated, while the culture around her tells a completely different story. These experiences, which circulate widely in social media conversations, appear frequently in Nollywood films as unremarkable background detail, and are documented in the testimonies of Nigerian working women, are not incidental. They are symptoms of a structural problem that formal policy alone has repeatedly failed to solve.

This paper takes those everyday experiences seriously as a point of departure. The academic question this study addresses are both theoretical and practical: under what conditions do gender equity policies actually improve the well-being of employees, and what does the Nigerian experience reveal about the limits and possibilities of those conditions? The study is situated within the field of applied communication because it argues that the answer lies, in large part, in how policies are communicated, who communicates them, whether that communication is consistent with observable organisational behaviour, and whether employees are given genuine channels to respond.

Gender equity policies typically address pay fairness, parental leave, recruitment and promotion procedures, protection from harassment, flexible working arrangements, and leadership representation. Each of these domains speaks to a specific dimension of the disadvantage that women and other marginalised groups face in the workplace. Collectively, they constitute what Kalev, Dobbin and Kelly (2006) describe as an equity architecture, the interlocking formal and informal mechanisms through which organisations either reinforce or disrupt gender-based inequality.

The global context is instructive. The World Economic Forum's Global Gender Gap Report (2023) estimates that at current rates of progress, it will take approximately 131 years to close the global gender gap across health, education, economy, and politics. In organisational terms, the McKinsey and LeanIn Women in the Workplace report (2024) found that despite two decades of diversity and equity investment, women remain significantly underrepresented in senior leadership, and women of colour continue to experience the highest rates of microaggressions and the lowest rates of feeling included.

Nigeria's position within this global picture is stark. The World Economic Forum ranked Nigeria 123rd out of 153 countries in gender equality in its 2022 report, reflecting deep and structural disadvantage across sectors (Vanguard, 2024). Yet Nigerian organisations, particularly in banking, telecommunications, and the public sector, have increasingly adopted formal gender equity policies, often in response to international investment standards or regulatory requirements. The result is a context in which policy formulation is proceeding faster than policy implementation, and where the gap between declared equity and lived experience is especially pronounced.

This paper proceeds through a review of theoretical frameworks and empirical literature, a qualitative methodological account, a presentation of findings organised into thematic categories, a discussion that connects theory to the Nigerian and global evidence, a statement of the study's contribution to knowledge, and a set of practical recommendations for organisations, communication practitioners, and policymakers.

LITERATURE REVIEW AND THEORETICAL FRAMEWORK

Defining Gender Equity and Its Policy Domain

Gender equity is distinct from gender equality in a way that matters practically. Equality means giving everyone the same thing. Equity means recognising that people do not begin from the same position and that achieving fair outcomes sometimes requires differentiated support. In the organisational context, this distinction has direct policy implications: an equity framework does not simply mandate identical treatment across genders but attends to the structural disadvantages that have historically shaped who gets hired, promoted, paid fairly, and protected from harm (Kabeer, 2005).

Formal gender equity policies in organisations cluster across several domains. Pay equity frameworks aim to close gender wage gaps through transparent salary banding, audits, and reporting obligations. Parental leave policies recognise that caregiving responsibilities disproportionately fall on women and that structural support for leave-taking affects both well-being and career progression. Anti-discrimination and anti-harassment provisions establish what conduct is unacceptable and what recourse is available. Leadership diversity targets seek to address the underrepresentation of women in senior roles. Flexible working arrangements acknowledge that a rigid presenteeism culture disadvantages those with caregiving responsibilities. Each of these domains represents a site where equity can be either realised or betrayed by the gap between formal provision and actual practice.

In Nigeria, several legislative frameworks nominally govern gender equity at work. The Constitution of the Federal Republic of Nigeria prohibits discrimination on grounds of sex in section 42. The Labour Act and the Violence Against Persons Prohibition Act (VAPP) provide additional protections. The Gender and Equal Opportunity Bill, though not yet passed into law at the federal level as of 2024, represents a legislative push toward a more explicit equity mandate (LIRAD, 2025). However, as legal analysts have observed, the existence of these provisions has not translated into consistent enforcement or into cultural shifts in how organisations treat their female employees (Owoyemi and Olusanya, 2023).

Social Equity Theory

Adams' (1965) theory of social exchange posits that individuals evaluate the fairness of their situation by comparing the ratio of their inputs (effort, skill, experience, commitment) to their outcomes (pay, recognition, promotion, respect) against the ratios of comparable others. When this comparison produces a

perception of inequity, whether through underpayment, exclusion from opportunity, or disrespect, it generates psychological distress, reduced motivation, and, over time, withdrawal from the organisation.

Applied to gender, this framework explains why women who observe or experience pay gaps, are routinely assigned tasks beneath their qualifications, or see less experienced male colleagues promoted ahead of them report lower well-being outcomes regardless of whether a formal equity policy exists. The policy is irrelevant to their equity perception if it has not changed the observable distribution of opportunities and respect. This is a critical point: the psychological effect of perceived inequity is not contingent on the absence of policy, but on the absence of equity in practice. A policy that has not been implemented is, from the employee's perspective, indistinguishable from no policy at all, and may in fact produce greater cynicism because the organisation knows what it should do and chooses not to do it.

Organisational Justice Theory

Colquitt, Greenberg and Zapata-Phelan (2005) extended the equity framework by identifying four components of organisational justice: distributive justice, which concerns the fairness of outcomes; procedural justice, the fairness of the processes that determine those outcomes; interpersonal justice, the respect and dignity with which employees are treated in daily interactions; and informational justice, the adequacy and honesty of the explanations employees receive for decisions affecting them.

Research consistently shows that procedural and interpersonal justice are stronger predictors of employee well-being and organisational commitment than distributive outcomes alone (Moorman, 1991). This finding has important implications for gender equity policy: employees who are paid equitably but excluded from high-profile projects, spoken over in meetings, or treated with less seriousness than their male counterparts still experience low interpersonal justice and the well-being costs that come with it. Formal pay equity, in other words, is necessary but not sufficient. The daily texture of how employees are treated communicates organisational values far more powerfully than any policy document.

Berlo's Communication Model and Policy Effectiveness

This paper draws on Berlo's (1960) Source-Message-Channel-Receiver (SMCR) model to argue that gender equity policy is fundamentally a communication act. The organisation is the source; the policy is the message; the channels through which the policy reaches employees include formal documents, leadership behaviour, training programmes, team culture, and informal norms; and employees are the receivers whose interpretation of the message determines its practical effect. Crucially, the SMCR model foregrounds the role of feedback: communication is incomplete without a mechanism through which receivers can signal whether the message has been received, understood, and found credible.

Many organisations treat policy communication as a one-way transmission: the policy is formulated, circulated, and filed. The assumption is that dissemination equals comprehension, and that comprehension equals behavioural change. Communication scholarship has consistently challenged this assumption. Katz and Kahn (1978) coined the term dead letter policy to describe formally correct documents that produce no behavioural change because they have not been meaningfully internalised, modelled, or reinforced through the organisation's communicative practice. Gender equity policies are particularly susceptible to this failure because they challenge existing power distributions, making their communication not merely administrative but politically and interpersonally consequential.

Empirical Evidence: Global and Nigerian Contexts

The empirical literature on gender equity and employee well-being is extensive and broadly consistent in its core finding: workplaces that implement equity policies genuinely, not merely symbolically, produce better outcomes for employees and organisations alike. Stainback, Tomaskovic-Devey and Skaggs (2010) found in a large-scale analysis of organisations in the United States that diversity and equity programmes were associated with higher employee satisfaction and lower voluntary turnover among women, but that the effect was significantly moderated by management commitment to implementation. The policy mattered far less than the seriousness with which it was enacted.

A phenomenon that has received growing attention in both global and Nigerian discussions is what Williams (2014) terms office housework, the routine assignment of low-status, administrative, and domestic-type tasks to women regardless of their professional seniority. This includes note-taking at meetings, organising catering, cleaning up after events, and serving refreshments to male colleagues. Williams, whose research is cited in both Fast Company and Monster.com's guidance for HR practitioners,

argues that office housework derails women's careers by consuming time that could be directed toward higher-value work, and by signalling, in a way that is visible to the whole organisation, that women's professional contributions are valued less than men's. In Nigerian workplaces, this dynamic is widely recognised in social and digital media discourse, where women regularly describe the expectation that they will handle the kitchen, prepare food for office events, and attend to the physical comfort of male colleagues regardless of their designation or expertise. That a junior male employee is rarely asked to make tea while a senior female employee routinely is not merely impolite: it is a communication act, transmitting an organisational message about whose time and whose intelligence matter.

The portrayal of this dynamic in Nollywood films, where female office characters are frequently shown serving, fetching, and accommodating while male colleagues lead, debate, and decide, reflects the degree to which these norms are culturally embedded and socially normalised. The media both reflects and reinforces these patterns, which is why communication-based approaches to equity must attend not only to internal organisational communication but to the broader cultural narratives within which organisations operate.

In Nigeria specifically, research documents patterns of discrimination that are structurally distinct from those in Western contexts. In the oil and gas sector, which dominates the South-South economic zone, women hold only 12 percent of senior management positions, and a 2021 survey found that 65 percent of women in formal employment in Port Harcourt identified the absence of childcare facilities as a major obstacle to career progression (Chukwu et al., 2021, cited in journals.aphriapub.com). Female street vendors in Calabar earned 60 percent less than male counterparts, reflecting how gender-based economic devaluation extends well beyond the formal sector (Udoh and Bassey, 2024). The testimony of Blessing I., a domestic worker in Port Harcourt documented by LIRAD (2025), captures the lived reality with clarity: most women like me do not have contracts or benefits. If I get sick or harassed, I have no rights and no protection.

The intersection of these structural realities with Nigeria's legislative framework creates a particular policy environment. The country has constitutional prohibitions on gender discrimination and sector-specific protections, but enforcement capacity is weak, cultural resistance to equity norms is strong, and the policies that do exist were often adopted in response to international pressure rather than organic organisational commitment (Owoyemi and Olusanya, 2023). This matters for implementation: a policy adopted because an international funder required it carries less organisational conviction than one adopted because leadership genuinely believes in its value, and employees are acute readers of that difference.

Cassell and Biswas (2000) documented the specific well-being impact of flexible working arrangements: access to flexibility significantly reduced psychological strain among women with caregiving responsibilities, but in organisations where flexibility was formally available but informally stigmatised, the policy's benefits were substantially eroded. Employees who used flexible arrangements were subtly excluded from high-visibility projects and overlooked in promotion cycles. This dynamic illustrates a broader principle: the informal communication of an organisation, what is actually rewarded and penalised in practice, always outcompetes the formal communication of written policy when the two are in conflict.

METHODOLOGY

This study adopts a qualitative systematic review methodology, synthesising evidence from peer-reviewed academic literature, international organisational reports, legal and policy analyses, and media accounts relevant to gender equity and employee well-being. The systematic review approach was chosen because it enables the identification of patterns and contradictions across a diverse body of evidence and is well suited to the study's dual objective of synthesising global findings and contextualising them within the Nigerian organisational environment.

Literature was drawn from peer-reviewed journals including the Journal of Organizational Behavior, Gender, Work and Organization, the International Journal of Human Resource Management, the Journal of Applied Communication Research, and the World Journal of Advanced Research and Reviews. Supplementary sources included reports from the International Labour Organisation, the World Economic Forum, the McKinsey and LeanIn Women in the Workplace series, the World Bank, and policy and advocacy publications from Nigerian civil society organisations including LIRAD Nigeria. Media sources including Vanguard News and TechEconomy Nigeria were included as contextual evidence for the Nigerian social media and public discourse dimension of the study.

Studies were included if they directly addressed gender equity policies, employee well-being, or their interaction in organisational settings, and if their findings could be meaningfully contextualised in

relation to Nigerian or comparable African workplace dynamics. Studies limited to highly industry-specific findings without broader generalisability were excluded unless they offered data specifically relevant to the Nigerian context. The temporal scope of the review covered publications from 2010 to 2024, with the exception of foundational theoretical works that remain the standard reference in their respective fields. Thematic analysis was applied to the synthesised literature, with four primary themes identified inductively and refined through iterative reading.

RESULTS AND FINDINGS

Theme 1: The Implementation Gap and the Role of Organisational Communication

The most consistently documented finding across the literature is that the effectiveness of gender equity policies is determined not by their content but by the conditions of their implementation, and that communication is the central variable in those conditions. Employees who are aware of equity policies, understand what they provide, and believe that leadership is genuinely committed to enforcing them report significantly higher levels of psychological safety, job satisfaction, and organisational trust than those who are unaware of or sceptical about available protections (Kalev et al., 2006).

Conversely, organisations that communicate equity policies primarily through compliance exercises, induction packs, annual emails, policy handbooks, without embedding those commitments in the daily behaviour of managers and the informal culture of teams, consistently produce what researchers call policy-practice decoupling (Stainback et al., 2010). In decoupled organisations, the formal policy framework and actual employee experience diverge sharply. The result is not simply ineffectiveness but active damage: employees in these environments often report greater cynicism and lower trust than employees in organisations with no formal equity policy at all, because the decoupling communicates that the organisation knows what it should do and has decided not to bother.

Theme 2: Office Housework and the Informal Communication of Inequality

The phenomenon of office housework represents one of the most clearly documented and widely experienced forms of informal gender discrimination in workplaces across both global and Nigerian contexts. Williams (2014) defines office housework as the routine assignment of low-value, administrative, and domestic type tasks to women regardless of seniority or expertise. This includes note-taking at meetings, organising refreshments, cleaning shared spaces after events, and managing the logistical and social labour that keeps offices functioning but carries no professional credit.

The well-being consequences are twofold. First, office housework consumes time that women could invest in the higher-value work that determines career advancement, creating a compounding professional disadvantage. Second, and perhaps more significantly for well-being, it is a communication act. When a senior female employee is asked to serve tea while her male counterpart of equal rank is not, the organisation has communicated something about whose time is valuable, whose expertise is respected, and whose professional identity is taken seriously. That message is received not only by the woman who is asked, but by everyone present, and it either normalises or challenges existing assumptions about gender and professional worth. In Nigerian workplaces, where social media commentary and shared professional experience consistently identify this pattern as common and culturally entrenched, the communicative dimension of office housework is particularly salient.

Theme 3: Leadership as Communicative Authority

Leadership behaviour emerges across the literature as the single most powerful determinant of whether gender equity policies improve employee well-being. Roberson and Stevens (2006) found that when senior leaders actively model equitable behaviour, including publicly endorsing equity initiatives, intervening when bias occurs in their presence, and holding managers accountable for equity metrics, employees report substantially higher well-being outcomes and greater confidence that the organisation's equity commitments are genuine.

This finding underscores the communicative function of leadership. Leaders are, in organisational terms, the most credible and visible communicators of institutional values. Their behaviour is read constantly and carefully by employees as an index of what the organisation actually values, as distinct from what it formally declares. A chief executive who champions gender equity in annual reports but maintains an all-male executive committee communicates a very specific message, and it is not the message in the

report. In Nigeria, where organisational culture tends toward strong respect for hierarchical authority, the communicative weight of leadership behaviour is arguably even greater than in flatter Western structures, making leadership commitment to genuine equity especially consequential.

Theme 4: Parental Leave, Cultural Double Binds, and Well-Being

Parental leave is among the most discussed and least consistently implemented components of gender equity frameworks. Globally, research documents a persistent double standard: women who take maternity leave frequently return to subtly diminished professional standing, with reduced access to visible projects, slower promotion trajectories, and informal reputations as less committed employees (Kossek and Pichler, 2007). In Nigerian organisations, this dynamic intersects with cultural expectations that women are primarily responsible for childcare and domestic management, creating what sociologists call a structural double bind. The woman who takes leave confirms cultural stereotypes about women's professional unreliability; the woman who does not take leave pays the personal cost of forgoing recovery and early caregiving time. Neither choice is supported by the policy framework she is supposed to benefit from.

Research from the ILO (2019) suggests that one of the most effective strategies for addressing this double bind is actively normalising male use of parental leave, both through formal policy provisions and through visible leadership modelling. In organisations where men in senior roles take and speak openly about paternity leave, the cultural stigma attached to leave taking is reduced for all employees. This again illustrates the communicative dimension of equity policy: what senior employees do communicate what is acceptable, often more powerfully than what the policy document says.

DISCUSSION

The findings of this review illuminate a pattern that has significant implications for how organisations, policymakers, and communication practitioners think about gender equity. The pattern is this: the formal architecture of gender equity policy has expanded considerably in both global and Nigerian contexts, but the communicative conditions required for that architecture to improve employee well-being have not kept pace. The result is a growing body of equity documentation that coexists with persistent inequality in the daily experience of working women.

This gap is not primarily a failure of policy design. The content of most contemporary gender equity frameworks is sound: pay equity, parental leave, anti-harassment provisions, and leadership diversity targets address real dimensions of workplace disadvantage. The failure is in the transmission. Organisations treat equity communication as an event rather than a process, something that happens at induction or in an annual compliance statement, rather than something that must be continuously enacted through leadership behaviour, management practice, team culture, and formal feedback mechanisms. From the perspective of Berlo's communication model, organisations are acting as if they can achieve communication by formulating a message and sending it once, with no attention to the channel, the receiver's interpretive context, or the feedback that would confirm whether the message has been understood and believed.

The Nigerian dimension of this pattern is shaped by specific structural conditions. Policy adoption in many Nigerian organisations has been driven by external pressure, international investment requirements, regulatory mandates, and global brand standards, rather than by organic institutional conviction. When policies originate from compliance rather than commitment, they are less likely to be embedded in organisational culture, less likely to be enforced consistently, and less likely to be communicated in ways that employees find credible. The Director of Social and Labour Affairs of the Nigeria Employers' Consultative Association, NECA, identified cultural beliefs, lack of gender-sensitive policies, and limited enforcement as the key factors sustaining workplace gender inequality in Nigeria (Vanguard, 2024). These factors are mutually reinforcing: cultural resistance to equity norms makes enforcement politically costly, weak enforcement undermines policy credibility, and low credibility reduces the communicative impact of the policy itself.

The phenomenon of office housework sits at the intersection of all these dynamics. It is informal enough to escape most formal policy frameworks. It is culturally normalised enough to be socially invisible in many Nigerian organisational contexts. And it carries a powerful communicative payload: every time a qualified female professional is asked to serve refreshments while her male counterpart is not, the organisation sends a message about gender and professional worth that no policy document can instantly counteract. Addressing this requires organisations to make the informal formal, to name the behaviour explicitly in equity training, to monitor it through climate surveys, and to make its correction a visible

leadership priority.

Comparing the Nigerian experience with global patterns reveals both shared dynamics and context-specific variations. The basic mechanisms of policy-practice decoupling, the role of leadership credibility, and the psychological consequences of perceived injustice operate consistently across national contexts, as the theoretical frameworks predict. What differs is the specific combination of cultural, legal, and institutional conditions that either reinforce or create space to challenge those mechanisms. Nigeria's combination of strong patriarchal cultural norms, weak institutional enforcement, and rapid formal policy adoption creates a particularly acute version of the implementation gap. But it also creates an opportunity: organisations that genuinely invest in communication-centred equity implementation in this environment are likely to see substantial well-being gains, precisely because the baseline of genuine implementation is currently low.

CONCLUSION AND RECOMMENDATIONS

This paper set out to examine the conditions under which gender equity policies translate into genuine improvements in employee well-being, using a dual Nigerian and global lens and locating communication at the centre of the analysis. The evidence reviewed here leads to a clear conclusion: gender equity policies are necessary but consistently insufficient as standalone instruments of change. Their effectiveness depends on the communicative conditions of their implementation, specifically whether they are communicated consistently, credibly, and through channels that reach employees in ways they find believable and actionable.

In both global and Nigerian contexts, the evidence shows that employees do not respond to equity policies as legal texts. They respond to them as messages, messages delivered not only through formal documents but through the behaviour of their managers, the allocation of tasks and opportunities, the visibility of women in senior roles, the seriousness with which complaints are handled, and the cultural norms that determine what is said and left unsaid in daily organisational life. When these communicative signals align with the formal policy commitment, well-being improves. When they diverge, no amount of policy documentation can compensate.

For Nigeria specifically, the path forward requires organisations to move beyond compliance-driven policy adoption toward genuine institutional commitment expressed through consistent communicative practice. This is not a small ask in a cultural environment where gender norms are deeply embedded and where policy enforcement mechanisms remain weak. But the evidence is unambiguous that surface-level adoption without cultural and communicative follow-through is not merely ineffective: it actively damages trust and produces the cynicism that makes future equity efforts harder to achieve.

RECOMMENDATIONS

Organisations should conduct regular equity communication audits, systematic assessments of how gender equity policies are communicated across levels, channels, and departments, to identify gaps between formal policy and employee awareness, trust, and perceived fairness.

Leadership development programmes should explicitly incorporate equity communication as a competency, training managers not only in policy content but in the daily communicative practices including consistent enforcement, visible modelling, and transparent decision-making that give policy its organisational credibility.

The informal dimension of gender inequity, including the routine assignment of office housework to female employees, should be named, monitored, and addressed through targeted training and climate surveys. Making the informal formal is a precondition for changing it.

Parental leave policies should be designed and communicated in gender-neutral terms, with active organisational encouragement for male employees to use them, to reduce the cultural stigma that currently makes these provisions more penalising than protective for many women.

Employee feedback mechanisms on equity policy implementation should be redesigned as genuinely two-way communication systems, in which what employees report demonstrably shapes policy revision and is seen to do so.

Nigerian policymakers should strengthen enforcement mechanisms for existing gender equity legislation, while organisations operating in Nigeria should invest in contextually adapted implementation strategies that engage with local cultural realities rather than importing frameworks without modification.

Finally, researchers in communication and adjacent fields should prioritise longitudinal primary

studies in Nigerian and West African organisational contexts, moving beyond the systematic review approach this paper employs toward empirical data that can capture how specific communicative interventions affect equity outcomes over time.

Gender equity in the workplace is not solved by writing a policy. It is solved, if it is solved at all, by organisations that understand themselves as communication systems in which every decision, every assignment, every meeting, and every promotion communicates something about whose work, whose time, and whose dignity the organisation values. Getting that communication right is how equity becomes well-being.
